Les explications à appliquer sont les suivantes

**Export your slideshow in DVD slideshow GUI as .flv.** (exporter le diaporama en flv

On the Flv exporter window please note that half of the sizes are for 16:9 the other half are for 4:3 formats. (ex. 320x240 = 4:3 and 320x180 = 16:9).

Keep size, bitrate and audio small for a faster streaming(loading) file.

Before you render press the 'Copy to clipboard' button and paste(ctrl+v) it into your html page/blog and press 'okay' for exporting the flv file.

Alternatively you can use this wizard to generate the code: [FlvPlayer wizard](#).

**Adding the FLV Video to your homepage:**

ajouter le lecteur FLV vidéo à votre page web

Download [href=&quot;http://www.jeroenwijering.com/?item=Flash\\_Video\\_Player](http://www.jeroenwijering.com/?item=Flash_Video_Player).

It includes a free Flash Video Player for your FLV video.

Upload the flvplayer.swf file that comes with Flash Video Player to your server.

Upload your .flv video file to your server.

In the code you pasted from DVD slideshow GUI replace <http://www.myhomepage.com/> with your address.

Add &autostart=1 to the video file if you want it to autoplay, like

Code:

file=http://www.myhomepage.com/myvideofile.flv&autostart=1
