Citation :

2014-01-02 - FileZilla Server 0.9.43 released

Fixed vulnerabilities:

Security fix: Disallow renaming and deleting of aliases through FTP commands

New features:

Removed outdated and untested Kerberos GSSAPI support

Removed support for the nonstandard OPTS UTF8 OFF command which is not part of the FTP specifications

Added TLS 1.2 support

Minimum RSA key size for generated certificates is now 1280 bit

Build system: Modernized and cleaned up workspace files for Visual Studio 2013

Build system: Removed all non-Unicode configurations

Bugfixes and minor changes:

Fix handling of leading/trailing whitespace in filenames

Fix display of file name at the end of a transfer

The 8+3 account setting is now stored in the correct XML element

Increase number of tries searching for a free port after the PASV/EPSV command

Fix text clipping on the miscellaneous page in the settings dialog

Fixed memory leaks when changing settings

The numbers to the PORT command are now always treated as decimal numbers as per the FTP specifications even if they have leading zeroes

Par contre sur sourceforge comme sur le site filezilla-project.org , je ne trouve cette fois de lien que vers le downloader qui propose des sharewares en plus... donc attention.
