Funny japan firefox clone, they make Firefox like chromium.

About Ablaze:

Ablaze is a group that creates and delivers applications for Linux, Floorp, extensions, and more. At present (2021/09/01), there are more than 30 active members, and more than 15 projects in progress, including unpublished projects.

Ablaze got source code from Kinza browser, they declared will be fork project of Kinza before.

Now they switch to Firefox based, seems they want a "Kinza face" browser.
