Crow Translate 2.10.10 du 2 août 2023

Changed

- Fix selection translation regression.

Note: The application uses submodules, so you need to download `crow-translate-<version>-source.tar.gz` in order to obtain the source code with all submodules included.

Note: On Linux to make the application look native on a non-KDE desktop environment, you need to configure Qt applications styling. This can be done by using `qt5ct` or `adwaita-qt5` or `qtstyleplugins`. Please check the appropriate installation guide for your distribution.

Note: Windows requires Microsoft Visual C++ Redistributable 2019 to work.
