Version 0.9.0 beta du 02/01/2025

<https://github.com/flexits/HotCornersWin/releases/tag/v0.9.0>

[https://github.com/flexits/HotCornersW ... tCornersWin.Installer.msi](https://github.com/flexits/HotCornersW...tCornersWin.Installer.msi)

- migrate to .NET 9;
- implement dark/lite color themes support with manual or system-wide switching as requested in #23 (this feature is experimental until .NET 10, there are some visual inconsistencies that I don't feel worth investing my time into fixing right now);
- detect nVidia GeForce Overlay window that fooled the app into turning itself off as if something entered the full-screen mode (issue #15) alongside with some other similar scenarios (however I'm afraid that's not the end with it, as I've discovered it's not uncommon for various applications to create such invisible windows and, on the other hand, SHQueryUserNotificationState doesn't always report a full-screen app being actually displayed);
- tray icon mouse clicks processing routine was re-written to avoid false triggering of single click action on double click or omitting single click after double click that was an issue previously;
- application now checks for already open forms thus preventing the user from opening several Settings or About windows.
